

A 3D object-based model to simulate highly-heterogeneous, coarse, braided river deposits

Emanuel Huber¹, Jef Caers¹, Peter Huggenberger²

¹Department of Geological Sciences, Stanford University

²Applied and Environmental Geology, University of Basel

Objectives

Motivations:

→ Geologically realistic subsurface heterogeneity model

Objective:

→ object-based model for coarse, braided river deposits

Coarse, braided river deposits:

- Highly heterogeneous in terms of hydraulic conductivity
- Important groundwater reservoirs worldwide

Objectives

Motivations:

→ Geologically realistic subsurface heterogeneity model

Objective:

→ object-based model for coarse, braided river deposits

Coarse, braided river deposits:

- Highly heterogeneous in terms of hydraulic conductivity
- Important groundwater reservoirs worldwide

Method

Observations → conceptualisation → model formulation

Observation: ancient deposits

Gravel carry Northeast Switzerland

Observation: ancient deposits

- Spoon-shaped trough fills
cross-bedding = layers of bimodal – open-framework gravel
- Horizontal/sub-horizontal layers of poorly sorted gravel
- Sand and open-framework lenses

Observation: ancient deposits

- Spoon-shaped trough fills
cross-bedding = layers of bimodal – open-framework gravel
- Horizontal/sub-horizontal layers of poorly sorted gravel
- Sand and open-framework lenses

Observation: ancient deposits

- Spoon-shaped trough fills
cross-bedding = layers of bimodal – open-framework gravel
- Horizontal/sub-horizontal layers of poorly sorted gravel
- Sand and open-framework lenses

Observation: ancient deposits

Hydraulic properties after Jussel et al. (1994)

	Poorly sorted gravel	Bimodal gravel	Open-framework gravel
Porosity	0.2	0.25	0.35
K_h	1.5×10^{-3} m/s	1.5×10^{-3} m/s	1×10^{-1} m/s
σ_{lnK}	0.5	0.1	0.1
K_h/K_v	6	1	1

Observation: geomorphology, key to dynamics

Depositional elements

- Trough fills ← scours at flow confluence
- Link to the topography of gravel sheets/unit bars
- Horizontal layers ← remnants of gravel sheets

50 m

Observation: geomorphology, key to dynamics

Depositional elements

- Trough fills ← scours at flow confluence
- Link to the topography of gravel sheets/unit bars
- Horizontal layers ← remnants of gravel sheets

Observation: geomorphology, key to dynamics

Depositional elements

- Trough fills ← scours at flow confluence
- Link to the topography of gravel sheets/unit bars
- Horizontal layers ← remnants of gravel sheets

Observation: geomorphology, key to dynamics

Depositional elements

- Trough fills ← scours at flow confluence
- Link to the topography of gravel sheets/unit bars
- Horizontal layers ← remnants of gravel sheets

Observation: geomorphology, key to dynamics

Depositional elements

- Trough fills ← scours at flow confluence
- Link to the topography of gravel sheets/unit bars
- Horizontal layers ← remnants of gravel sheets

Preservation potential

The deeper the depositional element, the higher the chance to be preserved in the geological records.

Conceptualisation

Structure

-  Poorly sorted gravel
-  Bimodal gravel
-  Open-framework gravel

Model formulation: object-based model

Object definition:

- Trough fills = truncated ellipsoids
→ $\mathcal{E} = x, y, z, \theta, l, w, h, r$
- cross-bedding: truncated ellipsoids
→ thickness bedding, position
- Horizontal layers
→ elevation z

- Layer deposition → Poisson process
- Trough fill deposition → Strauss process

Model formulation: object-based model

Object definition:

R-package: CBRDM

(Coarse Braided River Deposit Model)

Braided river dynamics

Simulations of two braided river dynamics:

- High sediment deposition rate (5 *cm*/event)
- Low sediment deposition rate (0.5 *cm*/event)

⇒ Impact on subsurface heterogeneity & subsurface flow

Braided river dynamics

High sediment deposition rate: 5 cm/event

Across valley orientation

Along valley orientation

Braided river dynamics

Low sediment deposition rate: 0.5 cm/event

Across valley orientation

Along valley orientation

Braided river dynamics & subsurface heterogeneity

High sediment deposition rate: 5 *cm*/event

Low sediment deposition rate: 0.5 *cm*/event

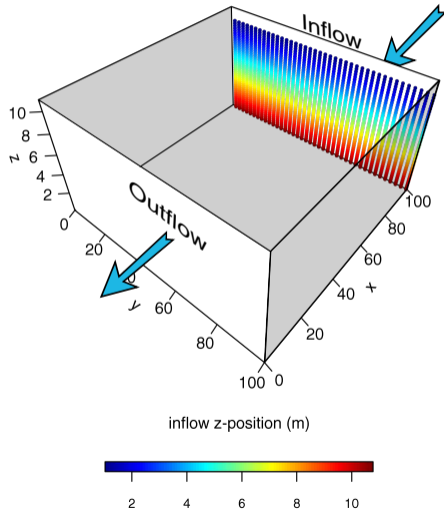

hydraulic conductivity (m/s)

hydraulic conductivity (m/s)

Braided river dynamics & subsurface flow field

Braided river dynamics & subsurface flow field

High sediment deposition rate (5 cm/event)

hydraulic conductivity (m/s)

inflow z-position (m)

Braided river dynamics & subsurface flow field

Low sediment deposition rate (0.5 cm/event)

hydraulic conductivity (m/s)

inflow z-position (m)

Conclusion

Take home message:

- Subsurface structure
- Object-based model
- Impact on the subsurface flow

Conclusion

Take home message:

- Subsurface structure
- Object-based model
- Impact on the subsurface flow

Future research:

- Link sedimentology - geomorphology
- Parameter inference based on geophysical data
